ISSUES TO FIX

1. REMOVE PAGES WITH A 404 ERROR : 50

Error404 page not found: the error 404 is the most common one. A page that returns a HTTP error code between 400-499 means that the page is not available, generally due to a broken link. These errors do not make a website very reputable. Visitors going specially to your site to find content then finding that they cannot get access to it, due to a error between 400-499, will not have a good souvenir of your site. What's more is that external links pointing towards these pages become useless and the link juice is transferred.

2. REMOVE PAGES WITH A 4XX ERROR : 14

A page that returns a HTTP error code between 400-499 means that the page is not available, generally due to a broken link. These errors do not make a website very reputable. Visitors going specially to your site to find content then finding that they cannot get access to it, due to a error between 400-499, will not have a good souvenir of your site. What's more is that external links pointing towards these pages become useless and the link juice is transferred.

3. CORRECT DUPLICATE CONTENT ERRORS : 1536

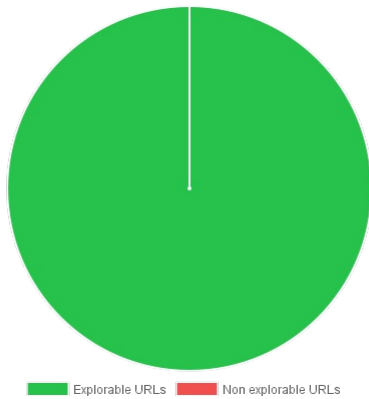

These are errors linked to similar content between two or more pages. From the search engines point of view pages with duplicate content are seen as identical. Even if they're accessible and valid, these pages will not be indexed in the search results. The exploration robots don't see any reason to index the "same" page twice.

4. IMPROVE THE PAGE PERFORMANCE: 3

This error appears when there are slow pages; a page with a loading time longer than 6s, or pages with a connection time longer than 800ms. The performance is directly linked to the user experience, the longer a visitor waits, the more likely they'll want to change sites. When it comes to performance, an optimized site prefers conversion and improvement in the search results position.
